Abstract of JP2001309600

PROBLEM TO BE SOLVED: To make the quality of a motor higher by performing the positioning of the tips of lead wires whose coverings are stripped off, increasing the operability for assembling of a stator for a motor whose connection is performed by arranging lead wires to be directly connected to the outside on a lead-wire fixing board, and connecting them to terminals connected to the coil ends of the stator. **SOLUTION:** This is a stator for a motor which is obtained by winding coils on stator insulating parts formed on a stator core, connecting the coils and lead wires to be connected to the outside for supplying power to these coils through terminals provided in the stator insulating parts, and fixing the lead wires to the lead wire fixing board. The lead wire fixing board is fitted with a lead-wire tip holding part for holding the tip of a lead wire whose covering has been stripped off, and performing the positioning of the tip of the lead wire.
